Programming Languages: Homework #8

Due on May 7, 2019 at 9:00am

Erin Keith Section 101

Michael DesRoches

Problem 1

Problem 2

(14pts) Write the rules for a predicate tally(E,L,N), which succeeds if N is the number of occurrences of element E in list L. The following query shows an example of using this predicate:

$$?-tally(3, [1,2,3,1,2,3],N).$$

 $N = 2$

```
\begin{array}{l} {\rm tally} \left( {_{-}}, \left[ {\right],0} \right). \\ {\rm tally} \left( {\rm E}, \left[ {\rm E} \right| L \right],N \right) \; :- \;\; {\rm tally} \left( {\rm E}, L,M \right), \;\; N \;\; {\rm is} \;\; M\!\!+\!\!1. \\ {\rm tally} \left( {\rm E}, \left[ {\rm F} \right| L \right],N \right) \; :- \;\; {\rm not} \left( E\!\!=\!\! F \right), \;\; {\rm tally} \left( {\rm E}, L,N \right). \end{array}
```

Problem 3

```
(15pts) Define predicates and/2, or/2, nand/2, nor/2, xor/2, and equ/2 (for logical equivalence) which succeed or fail according to the result of their respective operations; e.g.and(A,B) will succeed, if and only if both A and B succeed. Note that A and B can be Prolog goals (not only the constants true and fail).
```

```
\begin{array}{l} ?-{\rm and}\,(\,{\rm true}\,,\ \ {\rm true}\,)\,.\\ \\ {\rm \bf Solution}\\ {\rm and}\,(A,B)\,:=\,\,{\rm call}\,(A)\,,\,\,{\rm call}\,(B)\,.\\ \\ {\rm or}\,(A,{}_{-})\,:=\,A,\,\,!\,.\\ \\ {\rm or}\,({}_{-},B)\,:=\,B\,.\\ \\ {\rm nand}\,(A,B)\,:=\,\,{\rm not}\,({\rm and}\,(A,B))\,.\\ \\ {\rm nor}\,(A,B)\,:=\,\,{\rm not}\,({\rm or}\,(A,B))\,.\\ \\ {\rm equ}\,(A,B)\,:=\,\,{\rm or}\,({\rm and}\,(A,B)\,,\,\,{\rm and}\,({\rm not}\,(A)\,,{\rm not}\,(B)))\,.\\ \\ {\rm xor}\,(A,B)\,:=\,\,{\rm not}\,({\rm equ}\,(A,B))\,.\\ \end{array}
```

Problem 4

 $(15\,\mathrm{pts})\ \mathrm{Write}\ \mathrm{the}\ \mathrm{rules}\ \mathrm{for}\ \mathrm{a}\ \mathrm{predicate}\ \mathrm{gcd}\left(X,Y,G\right),\ \mathrm{which}\mathrm{determines}\mathrm{the}\ \mathrm{greatest}\ \mathrm{common}\ \mathrm{divisor}\ \mathrm{of}\ \mathrm{two}\ \mathrm{positive}\ \mathrm{integer}\ \mathrm{numbers}.\ \mathrm{Use}\ \mathrm{Euclid}\ \mathrm{'s}\ \mathrm{algorithm}:\ \mathrm{https://www.khanacademy.org/computing/computer-science/cryptography/}\ \mathrm{modarithmetic/a/the-euclidean-algorithm?-gcd}$

```
(36, 63, G).
G = 9
```

Problem 5

(Extra Credit -10 pts) Write the rules for a predicate flatten (A,B), which succeeds if A is a list (possibly containing sublists), and B is a list containing all elements in Aand its sublists, but all at the same level. The following query shows an example of using this predicate:

```
\begin{array}{lll} ?-flatten\left(\left[1\,,\;\left[2\,,\;\left[3\,,\;4\right]\right]\,,\;5\right],\;L\right). \\ L \,=\,\left[1\,,\;2\,,\;3\,,\;4\,,\;5\right] \end{array}
```

```
\label{eq:flatten} \begin{array}{lll} \text{flatten}\,(A,B) := & \text{flatten}\,(A,[]\;,B). \\ \text{flatten}\,(\text{Var},\;T,\;[\text{Var}|T]) := & \text{var}\,(\text{Var})\,,\;!. \\ \text{flatten}\,([]\;,T,T) := & !. \\ \text{flatten}\,([H|T]\;,TailList\;,List) := & !\;,\;\; \text{flatten}\,(H,FlatTail\;,List)\,,\;\; \text{flatten}\,(T,TailList\;,FlatTail). \\ \text{flatten}\,(\text{NonList}\,,T,[\,\text{NonList}\,|T]\,)\,. \end{array}
```
